Faster steps forward: towards cures for cancer and access to best treatment and care for individual patients.

Created by Lilly Oncology as a global collaboration spanning diverse sectors, PACE stands for Patient Access to Cancer care Excellence.

Progress against cancer is by nature stepwise, but with the insights and tools of today’s science, it does not need to be slow.

PACE exists to encourage public policies and health care decisions that speed the development of new medicines, assure cancer treatments respond to the needs and qualities of individual patients, and improve patient access to the most effective cancer medicines.

Together and with each step, we can build momentum towards cures.

• Lilly Oncology has launched a global network to help improve the way in which decisions are made on cancer-related policy, the development of new treatments and patient access to care.

• We’re putting the interests of patients at the center of our efforts and work in a collaborative way with many stakeholder groups.

• Called PACE, or Patient Access to Cancer care Excellence, the initiative aims to speed up the progress of R&D in cancer treatment and encourage policies that give more patients access to high-quality, personalized cancer care.

• We surveyed cancer patients, caregivers and the public in several countries to understand their perspectives—and will continue to “ask people first.”

• To achieve our goals, we’re implementing public initiatives, policy research, training programs, events and a variety of communications efforts.
